Flashcards | Quizlet

Generalized Functions of Epithelial
Tissue. Epithelial tissues provide the
body's first line of protection from
physical, chemical, and biological wear
and tear. The cells of an epithelium act as
gatekeepers of the body controlling
permeability and allowing selective
transfer of materials across a physical
barrier.

Introduction. Epithelia are tissues consisting of closely apposed cells without intervening intercellular substances.

Epithelia are avascular, but all epithelia "grow" on an underlying layer of vascular connective tissue. The connective tissue and the epithelium are separated by a basement membrane. Epithelium covers all free surfaces of the body. Epithelium also lines the large internal body cavities, where it is termed mesothelium.

As mentioned, epithelial tissue is one of the four main types of tissue in the human body. It's ubiquitous, covering body surfaces, lining blood vessels and internal cavities. There are two main types of epithelial tissue: simple epithelium, and stratified epithelium. But what are their features and subtypes?

Epithelial tissue quizzes and free worksheets | Kenhub

Epithelium is one of only 4 types of human body tissues. Like all types, it is formed by cells within an extracellular matrix (ECM). The cells in this tissue are tightly packed within a thin ECM.

Forming sheets that cover the internal and external body surfaces (surface epithelium) and secreting organs (glandular epithelium). Functions of epithelial tissue are secretion, protection, absorption, transportation and special sensory receptive.
