For multiplication, use the * symbol. A * symbol is not necessary when multiplying a number by a variable. For instance: $2 * x$ can also be entered as $2x$. Similarly, $2 * (x + 5)$ can also be entered as $2(x + 5)$; $2x * (5)$ can be entered as $2x(5)$. The * is also optional when multiplying with parentheses, example: $(x + 1)(x - 1)$. Start with: $a^2 + b^2 = c^2$. Put in what we know: $12 + 12 = c^2$. Calculate squares: $1 + 1 = c^2$. $1+1=2$: $2 = c^2$. Swap sides: $c^2 = 2$. Square root of both sides: $c = \sqrt{2}$. Which is about: $c = 1.4142...$ It works the other way around, too: when the three sides of a triangle make $a^2 + b^2 = c^2$, then the triangle is right angled.

Pythagoras Theorem - MATH

The exponents on a and b always add up to $1/2$, and the numeric coefficient " $1/2$ choose n" (similar in construction to m-choose-n for m integer, although without the usual combinatorial applications) has a falling factorial in the numerator starting with factor $1/2$ and with each factor 1 less than the previous, up to n factors, with the ordinary n! in the denominator.
