Of Coal Chemistry Of

Coal is a combustible black or brownish-black sedimentary rock, formed as rock strata called coal seams. Coal is mostly carbon with variable amounts of other elements; chiefly hydrogen, sulfur, oxygen, and nitrogen. Coal is formed when dead plant matter decays into peat and is

Coal is formed mainly by geological processes. It is a type of fossil fuel created from the remains of dead plants many years ago. It has been classified as a nonrenewable energy source. Further, coal is composed of elements like carbon, sulphur, hydrogen, nitrogen and oxygen amongst others.
