The finite element method is the most widely used method for solving problems of engineering and mathematical models. Typical problem areas of interest include the traditional fields of structural analysis, heat transfer, fluid flow, mass transport, and electromagnetic potential. The FEM is a particular numerical method for solving partial differential equations in two or three space variables. To solve a problem, the FEM subdivides a large system into smaller, simpler parts that are called fini

Abstract Consolidation analysis using nonlinear finite element method is performed to study the behaviour of a footing resting on soil mass. Four noded isoparametric plane strain element with two translational degrees of freedom is used to model the soil deformation. Pore pressure is also modeled using four noded isoparametric element.
