In order to breathe, your tank must have a vent somewhere that will relieve both vacuum and pressure. Gasoline expands in volume as it warms up and shrinks in volume as it cools down. The fuel level of your tank changes throughout the day, even if you are not driving it.

What is the Fuel Tank Ventilation Valve? - Motor Vehicle ...

The fuel tank vent valve is part of a vehicle's evaporative emission control (EVAP) system, which lowers the amount of vapors released from the fuel tank into the atmosphere. The fuel tank vent valve controls the flow of air getting into and out of the charcoal canister. One side of the fuel tank vent valve is connected to the charcoal canister and the other to a vent hose. The valve is controlled by the engine computer. Over time, the fuel tank vent valve can become clogged and be stuck open.

The tank venting valve on the 1100 and 1150 is located on the filler neck. The reason for this is that the vapours that your car regularly uses in combustion will find the EVAP canister and eventually be vented to the environment, meaning that you will lose a portion of the fuel regularly used in burning.
