An encyclopedic how-to of all you need to make your home green Whether because of changing lifestyles or simply because houses are

becoming outdated, millions of North Americans are renovating their homes every year, spending more money annually on renovation than on new home construction. But renovations can be fraught with unintended consequences like indoor air pollution. How do you remodel in a healthy, environmentally friendly way? Green Remodeling is a comprehensive guide. It first points out the advantages of remodeling. Buildings are responsible for 40% of worldwide energy flow and material use; so how you remodel can make a difference. Upgrading furnaces, cabinets and toilets means less fossil fuel pollution, reduced resource depletion, and fewer health risks. Green remodeling is more energy-efficient, more resource-conserving, healthier for occupants and more affordable to create, operate and maintain. The book then discusses simple green renovation solutions for homeowners, focusing on key aspects of the building including foundations, framing, plumbing, windows, heating and finishes. Room by room, it outlines the intricate connections that make the house work as a system. For example, how new windows may affect the structure and mechanical systems of the rooms below, the health of the family, and the future of old-growth forests. Then, in an easy-to-read format complete with checklists, personal stories, expert insights and an extensive resource list, it covers easy ways to save energy, conserve natural resources, and protect the health of loved ones. Addressing all climates, this is a perfect resource for conventional homeowners, as well as architects and remodeling contractors.

A guide to home building, renovation, and decorating for environmentally conscientious readers or home owners looking to promote energy efficiency explains how to reduce one's personal carbon footprint, lower costs, and promote an eco-friendly lifestyle while creating one's dream home.

Book features Forward, Contents, Builder's Matrix. The information in this book was developed primarily for home builders, but others will find it useful. The book is intended to be national in scope, so all of the construction information and examples are not relevant for all climates. At the end of each section, readers will find "Interactions," references to other sections of the book that describe design strategies, systems, components, or materials that interact in important ways with the topic of the chapter.
