Low Level Programming In C. In addition to the high level language constructs, (data type and operators), C also supports low level programming features which enable the programmer to carry out bit-wise operations. These features are normally provided in assembly language or machine language. The bit level operations and register variables discussed in this section can be thought of as a bridge between high level programming constructs and assembly / machine language operations.

As C is considered a low-level language, you can often do much of this type of programming in C. But not all of it. Sometimes one must resort to assembly language, which usually has a one to one correspondence (unless one is using macros) to the machine instructions of the machine. Mathematically a number system in any base works equally well.

For example, everything relating to encoding or decoding and encryption will probably use low level programming, with C and probably some assembly to use extended instruction (like AVX, SSE, etc). Basically, everything that needs high-performance and fine tuning will require a bit of low level programming. Jobs That Require Low Level Programming

A low-level languages are designed for the ease of the computer running the language. C is just a step up from assembly language, which is practically a human translation of machine code. It doesn't get any lower than machine code, but people don't read hexadecimal very well, so assembly is considered the lowest level programming language.

*How "low" does C go as a "low-level" language? - Stack ...*

The lowest low level language is Assembly languages that is just next to machine code. The most popular low level programming language is C, as most of operations that are written in C uses less machine code instruction and thus runs very fast. So, if you want to write a program that should run at high speed like Kernel or Operating System.

*What is High Level and Low Level Programming Language ...*

A low-level programming language is a programming language that provides little or no abstraction from a computer's instruction set architecture—commands or functions in the language map closely to processor instructions. Generally, this refers to either machine code or assembly language. Because of the low abstraction between the language and machine language, low-level languages are sometimes described as being "close to the hardware". Programs written in low-level languages tend to be ...

When doing low level development, you are mainly dealing with how to get the machine to perform a specific task as efficiently as possible. The entities that you are dealing with are most of the time highly technical in nature, like memory blocks, block chains, hash values, etc. and your logic has nothing to do with the real world, and everything to do with the machine.

If you have any experience with low level programming of microcontrollers, then you know that everything is done by writing to the registers in the memory of the device. If you, for example, want to set a pin high, then you write a "1" to the register that corresponds to that certain pin.

C++ (U ? s ! ? ? p 1 ? s ? ? p 1 ? s ? ? p 1 ? s ? ? p 1 ? s ? ) is a general-purpose programming language created by Bjarne Stroustrup as an extension of the C programming language, or "C with Classes".The language has expanded significantly over time, and modern C++ now has object-oriented, generic, and functional features in addition to facilities for low-level memory manipulation. It is almost always ...

It was mainly developed as a system programming language to write operating system. The main features of C language include low-level access to memory, simple set of keywords, and clean style, these features make C language suitable for system programming like operating system or compiler development.

*Why learning C Programming is a must? - GeeksforGeeks*

C is a common example of a low-level language. Its syntax is a lot more arcane than Python's, but it's more useful if you want to optimize hardware performance. Graphics programming and certain kinds of high-performance computing (HPC) are domains where you're likely to be using a low-level language.
