TUTORIAL: NETCONF AND YANG The Meaning of Transactions The four properties that define a transaction: ACID Atomicity • Transactions are indivisible, all-or-nothing Consistency • Transactions are all-at-once • There is no internal order inside a transaction, it is a set of changes, not a sequence • Implies that { create A, create B } and { create B, create A } are identical • Implies that a system behaving differently with respect to the sequence is not transactional Independence ...

NETCONF YANG tutorial - SlideShare

The 2016 version of NETCONF uses YANG to structure the data that is sent and received, which makes is much simpler to work with programatically. In the past, you would need to "screen scrape" CLI with regular expressions to extract specific pieces of information. To enable the NETCONF, a single command is required.
