However, did you know that you don't need to use an OOP language in order to use OOP style and get some of the benefits of object-oriented programming?

*Object-Oriented Programming (OOP) in C | Codementor*

Object-oriented programming (OOP) is not the use of a particular language or a tool. It is rather a way of design based on the three fundamental concepts:

- Encapsulation- the ability to package data and functions together into classes

object-oriented programming, we have to manually pass pointer to the object for which method is called. To avoid useless confusion, I use the name `me` instead of `this`. Here's the easiest interface for this, ever:

Object-based and object-oriented programming is to encapsulate an algorithm and a set of data structures in an object. Therefore, a new concept was formed: Object = algorithm + data structure

Programming. Procedural programming is about writing procedures or methods that perform operations on the data, while object-oriented programming is about creating objects that contain both data and methods. Object-oriented programming has several advantages over procedural programming:

*C# OOP (Object-Oriented Programming)*

Characteristics of an Object Oriented Programming language Class: The building block of C++ that leads to Object-Oriented programming is a Class. It is a user-defined data type, which

holds its own data members and member functions, which can be accessed and used by creating an instance of that class. A class is like a blueprint for an object.

*Object Oriented Programming  
in C++ - GeeksforGeeks*

Object-oriented programming is more than just classes and objects; it's a whole programming paradigm based around [sic] objects (data structures) that contain data fields and methods. It is essential to understand this; using classes to organize a bunch of unrelated methods together is not object orientation.

Object-oriented programming aims to implement real-world entities like inheritance, hiding, polymorphism, etc in programming. The main aim of OOP is to bind together the data and the functions that operate on them so that no other part of the code can access this data except that function.
