The Henderson-Hasselbalch equation can be used to calculate the pH of a solution containing the acid and one of its salts, that is, of a buffer solution. With bases, if the value of an equilibrium constant is known in the form of a base association constant, K_b the dissociation constant of the

Henderson-Hasselbalch equation - Wikipedia

The Henderson-Hasselbalch equation can be written as: $pH = pK_a + \log_{10} ([A^-]/[HA])$ Where $[A^-]$ denotes the molar concentration of the conjugate base (of the acid) and $[HA]$ denotes the molar concentration of the weak acid. Therefore, the Henderson-Hasselbalch equation can also be written as:

Henderson-Hasselbalch Equation - Estimating the pH of Buffers

The Henderson-Hasselbalch equation relates pH, pKa, and molar concentration (concentration in units of moles per liter):
 $pH = pK_a + \log_{10} ([A^-]/[HA])$ $[A^-]$ = molar concentration of a

Henderson-Hasselbalch Equation and Example

The pH of a solution containing a weak acid is related to its acid dissociation constant. The relationship can be stated in the convenient form of the Henderson-Hasselbalch equation, derived below: A weak acid, HA, ionizes as follows: $HA \rightleftharpoons H^+ + A^-$ The equilibrium constant for this dissociation is written as follows: $K_a = \frac{[H^+][A^-]}{[HA]}$

of a solution and the pK_a or pK_b and the ratio of the concentrations of the dissociated chemical species. In order to use the equation, the acid dissociation constant must be known.

Henderson Hasselbalch Equation Definition - ThoughtCo

In its general form, the Henderson-Hasselbalch equation is a useful expression for buffer calculations. It can be derived from the equilibrium constant expression for a dissociation reaction of the general weak acid (HA) in Equation (1.3): (1.4)
$$K = \frac{[H^+][A^-]}{[HA]}$$
 where K is the equilibrium constant at a given temperature.

Approximate pH values obtained from the Henderson-Hasselbalch equation are compared with exact hydrogen ion concentrations and the percentage errors are displayed as a function of the acid dissociation constant and buffer composition (titration mixture).

The Henderson-Hasselbalch Equation: Its History and ...

The Henderson-Hasselbalch equation gives you information of the abundance of ionized and unionized fractions of molecules within a given solution. This is useful for certain reactions as well as important for absorption, distribution and excretion of drugs. Hence it is very useful in fields of chemistry, biochemistry, and pharmacy.

Henderson-Hasselbalch Equation: Derivation | Analytical ...

Consider the dissociation equation for acetic acid: $\text{HAc} \rightleftharpoons \text{H}^+ + \text{Ac}^-$ Increasing the concentration of the acetate (Ac^-) will push the equilibrium back to the left, decreasing the concentration of H^+ . This makes the solution less acidic, making the pH of the buffer larger than the pure acid solution.

i.e. The Henderson-Hasselbalch equation is written as: $\text{pH} = \text{pK}_a + \log \left(\frac{[\text{A}^-]}{[\text{HA}]}\right)$ We already know the values for $[\text{A}^-]$ and $[\text{HA}]$. Thus we only need to convert the K_a into pK_a .

Note- Make sure the units for the $[\text{A}^-]$ and $[\text{HA}]$ are in molar (M) units. $\text{pK}_a = -\log K_a = -\log 1.8 \times 10^{-5} = 4.7$. Step 3.

Insert all knowns into Henderson-Hasselbalch equation and calculate the unknown pH. $\text{pH} = \text{pK}_a + \log \left(\frac{[\text{A}^-]}{[\text{HA}]}\right)$

Applications and Example Problems Using Henderson ...

The Henderson-Hasselbalch equation is used mostly to calculate pH of solutions created mixing known amounts of acids and conjugate bases (or neutralizing part of acid with a strong base). For example, what is the pH of a solution prepared mixing reagents so that it contains 0.1 M of acetic acid and 0.05 M NaOH?

The following equation, which relates the pH of an aqueous solution of an acid to the acid dissociation constant of the acid, is known as the Henderson-Hasselbach equation. $\text{pH} = \text{pK}_A + \log_{10}[\text{conjugate base}] [\text{weak acid}]$ The Henderson-Hasselbach equation is derived from the definition of the acid dissociation constant as follows.

$$\text{pH} = \text{p}K_a + \log\left(\frac{[A^-]}{[HA]}\right)$$
, where pH is the concentration of $[H^+]$, $\text{p}K_a$ is the acid dissociation constant, and $[A^-]$ and $[HA]$ are concentrations of the conjugate base and starting acid.

The Henderson-Hasselbalch Equation | Introduction to Chemistry

The Henderson-Hasselbach equation is used to compare these values, and is written as: In this question, this equation can be written with the given values of K_a and pH. Since we know the K_a of HCN, we can derive the $\text{p}K_a$, which turns out to be 9.2.

The Henderson-Hasselbalch equation is, of course, the mass action expression cast in logarithmic format, and many students of chemistry have wondered if the thought of taking the logarithm of both sides of an expression should warrant immortalization of these two scientists.

The Henderson-Hasselbalch Equation: Its History and ...
However, the Henderson-Hasselbalch equation for a basic buffer will give pOH and its pH can be calculated as (14 - pOH). 2. The dissociation constant of a weak acid (or weak base) can be determined by measuring the pH of a buffer solution containing equimolar concentrations of the acid (or base) and the salt.

Henderson-Hasselbalch equation and its Significance
Henderson-Hasselbalch equation is a simple expression which relates the pH, pKa and the buffer action of a weak acid and its conjugate base. The Henderson-Hasselbalch equation also describes the characteristic shape of the titration curve of any weak acid such as acetic acid, phosphoric acid, or any amino acid.
